#### 11.1. Information on toxicological effects

Acute toxicity Estimate: LD50 > 2000 mg/kg (Ingestion)

Sensitization Estimate: Non-sensitizing

Germ cell mutagenicity Ames Test (S. typhimurium, E. coli): Negative

Carcinogenicity

The IARC evaluated carbon black as a Group 2B carcinogen, for which there is inadequate

human evidence, but sufficient animal evidence. The latter is based upon the development of lung tumors in rats receiving chronic inhalation exposure to powdered carbon black at

levels that induce particle overload of the lung.

However, there is a two-year inhalation study of a toner containing carbon black which demonstrated no association between toner exposure and tumor development in rats.

Reproductive toxicity No data available

STOT - single exposure No data available

STOT - repeated exposure Muhle et al. reported pulmonary response upon chronic inhalation exposure in rats to a

toner enriched in respirable-sized particles compared to commercial toner. No pulmonary change was found at 1 mg/m³ which is most relevant to potential human exposure. A minimal to mild degree of fibrosis was noted in 22% of the animals at 4 mg/m³, and a mild to moderate degree of fibrosis was observed in 92% of the animals at 16 mg/m³. These findings are attributed to "lung overloading", a generic response to excessive

amounts of any dust retained in the lung for a prolonged interval.
