SECTION 11: Toxicological information

11.1. Information on hazard classes as defined in Regulation (EC) No 1272/2008

| | |
|--|--|
| Acute toxicity | LD50 > 2000 mg/kg (Ingestion) |
| Skin corrosion/irritation | Non-irritant |
| Serious eye damage/eye irritation | Transient slight conjunctival irritation only. |
| Sensitization | Non-sensitizing |
| Germ cell mutagenicity | Ames Test (S. typhimurium, E. coli): Negative |
| Carcinogenicity | The IARC evaluated carbon black and titanium dioxide as Group 2B carcinogens, for which there are inadequate human evidences, but sufficient animal evidences. The latter are based upon the evidences such as development of lung tumors in rats receiving chronic inhalation exposure to powdered carbon black and titanium dioxide at levels that induce particle overload of the lung. Also European Chemical Agency evaluated titanium dioxide in powder form containing 1% or more of particles with aerodynamic diameter ≤ 10µm as a Group 2 carcinogen under EU Regulation (EC) No 1272/2008 for similar reason. However, there are inhalation studies of a toner containing carbon black and a toner containing titanium dioxide which demonstrated or suggested no association between toner exposure and tumor development in rats. |
| Reproductive toxicity | No data available |
| STOT - single exposure | No data available |

STOT - repeated exposure

Muhle et al. reported pulmonary response upon chronic inhalation exposure in rats to a toner enriched in respirable-sized particles compared to commercial toner. No pulmonary change was found at 1 mg/m³ which is most relevant to potential human exposure. A minimal to mild degree of fibrosis was noted in 22% of the animals at 4 mg/m³, and a mild to moderate degree of fibrosis was observed in 92% of the animals at 16 mg/m³. These findings are attributed to "lung overloading", a generic response to excessive amounts of any dust retained in the lung for a prolonged interval.
